

ASSIGNMENT-3

Name: Y. Jaya Rama Krishna

Registration Number: 20BEC0169

Creating Dashboard:

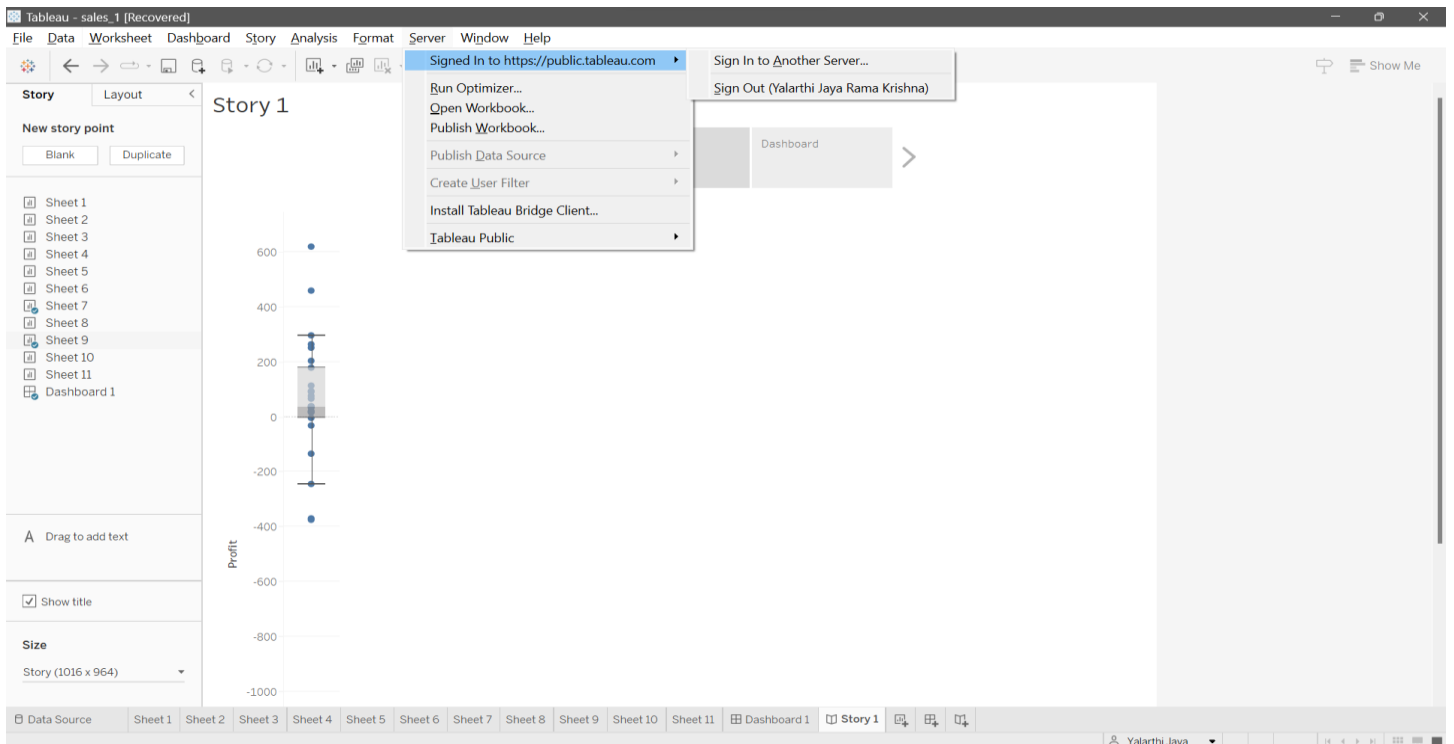

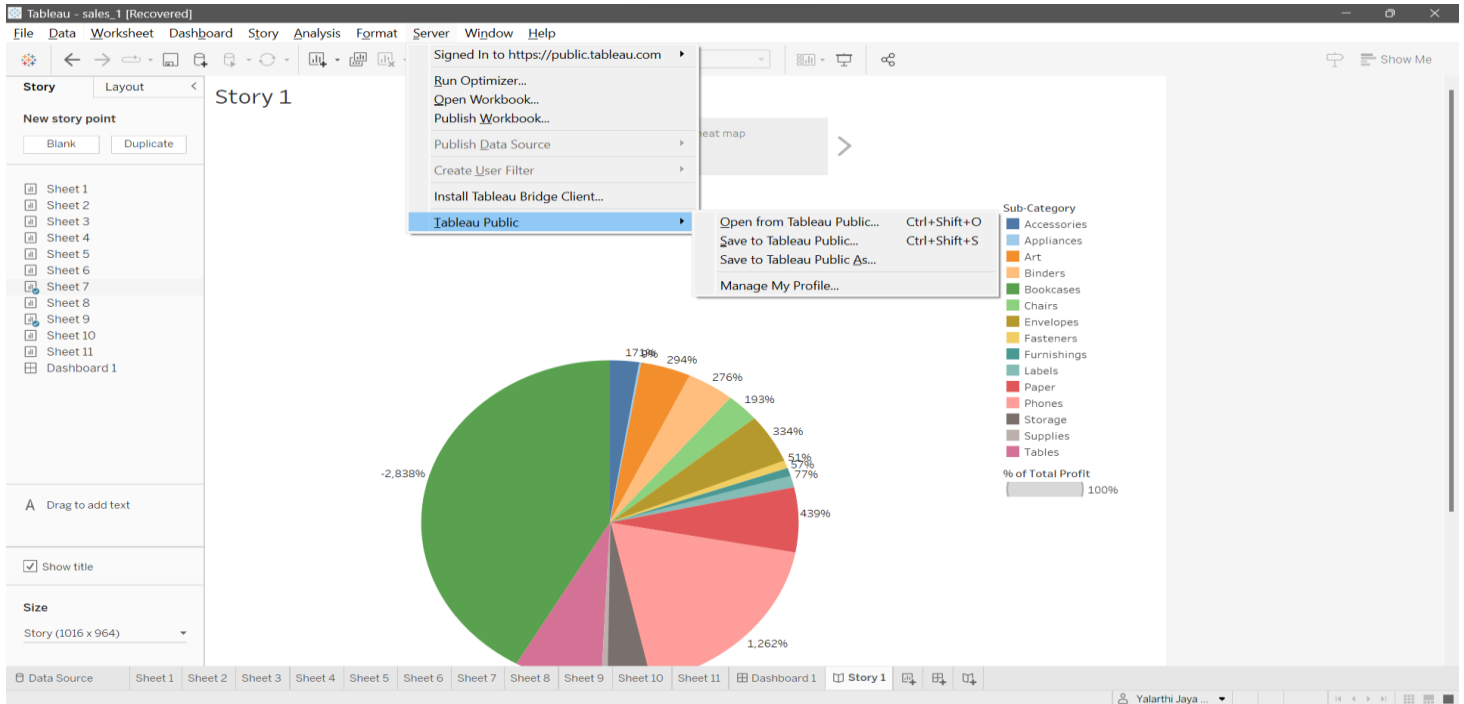

A dashboard in data analytics is a visual display of important information and metrics derived from data, presenting it in a concise and accessible format. It offers a centralized view of key performance indicators (KPIs) and other relevant data, allowing users to monitor and analyze trends, patterns, and outliers. Dashboards typically consist of charts, graphs, tables, and other visual components that present data in an intuitive and interactive manner. Users can interact with the dashboard, applying filters, drill-down capabilities, and other features to explore and gain deeper insights from the data. The primary goal of a dashboard is to enable data-driven decision-making by providing a clear, real-time overview of relevant information to stakeholders.
